TR-06 // COOKING WITHOUT POWER

1. PHASE ALPHA: CRISIS RUN ('OMG I NEED TO HEAT FOOD NOW!!!')

■ **MANDATORY VENTILATION RULE:** Never ignite a butane stove, propane camp stove, white gas liquid burner, or charcoal grill inside a house, garage, or enclosed shelter. Keep all alternative cooking burners a minimum of 10 feet away from open house windows or exterior doors.

■ **THE PROPANE/BUTANE VALVING CHECK:**
1. Inspect the threaded valve seals on your portable canister for debris before mounting.
2. Screw the cylinder tightly onto the stove threads until the mechanical connection is solid.
3. Wipe soapy water over the valve connection lines. If bubbles expand, your line is leaking. Disconnect it immediately.

■ **ZERO-MATCH IGNITION PROTOCOL:** Turn the fuel dial counter-clockwise until you hear the hissing of escaping gas. Click the integrated piezo-electric starter button immediately, or pass a ferrocerium spark cluster directly over the burner cap to ignite.

2. PHASE BRAVO: LONG-TERM PLANNING & SUSTAINED HEAT LOGISTICS

■ **THE THERMAL ROCK STOVE CIVIL ENGINEERING:** Excavate a shallow, 6-inch deep trench into bare mineral soil. Line the bottom and sides with solid, non-porous granite or river rocks. Stack your bricks or flat rocks into a tight U-shaped wall 8 inches high. This concentrates all wood combustion directly under your pot.

■ **THE METRIC BOILING HEAT RETENTION LOOP:** Bring your food or water to a rolling boil on the rock stove for exactly 5 minutes, seal the pot with a tight metal lid, wrap it completely inside a thick wool blanket or an insulated foam box, and place it aside.

CRITICAL PANEL / REFERENCE REGISTER
Odorless, invisible carbon monoxide gas will accumulate rapidly in unventilated areas. Never leave any active burner unattended during the cooking cycle. Keep a certified Class ABC fire extinguisher within arm's reach.
