TR-07 // POWER & CHARGING

1. PHASE ALPHA: CRISIS LOAD SHEDDING ('OMG MY PHONE IS AT 12%!!!')

■ **IMMEDIATE INSTANT ACTION SCREEN PROTOCOL:**

1. Access your phone settings panel. Turn on Extreme Battery Saver Mode.
2. Manually drop your screen brightness to its absolute minimum level (10% or lower).
3. Turn off your Cellular Data, Wi-Fi, Bluetooth, and GPS Location tracking systems entirely.
4. Force-close all background data sync loops.

■ **THE PRESERVATION ORDER:** Keep your device switched completely OFF or locked in Airplane Mode. Power it on for exactly 3 minutes every hour on the hour to check for emergency civil broadcast updates, then shut it down immediately.

2. PHASE BRAVO: LONG-TERM POWER RECOVERY & STORAGE METRICS

■ **LITHIUM-ION (Li-ion) CELL LIFESPAN CAPS:** Cycle stored batteries between a 20% floor and an 80% charging ceiling. CRITICAL TEMPERATURE LIMIT: Never charge a lithium-ion cell if the ambient temperature is below freezing (32°F).

■ **LEAD-ACID AGM BLOCK SPACING:** Store heavy vehicle or backup solar batteries elevated on thick wooden pallets or block spacers off bare concrete floors. Never let depth of discharge drop below 50%.

■ **SOLAR PERPENDICULAR ORIENTATION SYSTEM:** Prop the panel up at a 30-to-45 degree tilt angle, facing directly south (for Pace, FL coordinates). Adjust the tilt angle manually three times a day to follow the sun's path.

CRITICAL PANEL / REFERENCE REGISTER
Shorted or punctured lithium-ion cells release toxic gases and produce intense thermal runway fires. Never charge batteries inside sealed plastic boxes or directly underneath combustible survival gear caches.
